

CONTRACTOR UPDATE

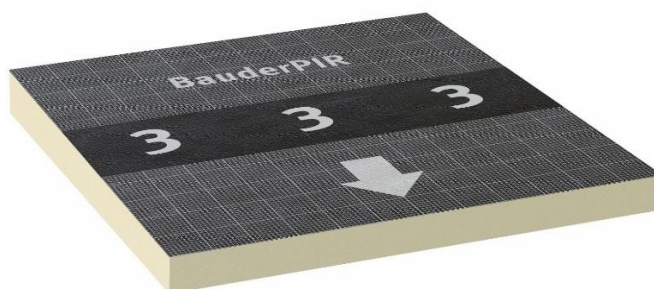

Supply of Bauder Tapered Insulation

Following on from our successful launch of PIR FA Tapered Insulation last year, Bauder approved contractors have provided positive feedback of this system including the easier installation techniques. We would like to update you on the design and lead times for our tapered insulation products.

Standard Bauder Tapered Boards

Our default standard board for current tapered design is Bauder PIR FA Tapered. This is available with a fall of 1:60 and is used in conjunction with FA-TE as a base layer.

These boards are available with lead times of 5 working days as standard, and 15 working days for larger projects.

Tapered gutters: For tapered gutter designs within FA Tapered design – the default board is our un-faced PIR T tapered board with a fall of 1:80. This complies with the minimum fall requirements of BS6229.

We will stock these types of boards with supply times expected to be 5 working days.

PIR T Tapered

PIR T tapered supplied at 1:60 fall has seen a natural decline following the success of the PIR FA Tapered. For this reason, our stocks have been adjusted. As a result, our lead-time will be increased from 5 working days for stocked items to 15 working days effective from 1st June 2020.

Bauder PIR T in various falls will continue to be available on a 15 working day lead-time.

For all Tapered schemes, please refer to your Tapered Quotation for specific lead-times.

Product Data Sheets

The Product Data Sheets are available upon request.

Design Service

Our technical team will design bespoke tapered insulation schemes for individual projects and provide advice for flat roof fall design. The project specific design provided by Bauder **must** be followed on site to ensure the correct design, falls and U-Value are achieved. If the scheme is incorrectly set out and has been started from the wrong starting point, then the scheme may not achieve its designed performance.
